HRBP AI Claim Verification

Two-page diagnostic case study | Skill HRBP-AI-05 | Proposed 30-day pilot

EVIDENCE BOUNDARY Status: Case design, not a completed corporate pilot. All example HR communications and people data below are fictional; real company policies, employee test scores, permissions and business outcomes are unavailable.

01 Specific performance problem and consequence

An HR Business Partner uses generative AI to draft an employee/manager update about an AI-awareness session. The draft adds “attendance is mandatory” and “every participant receives a certificate”, although neither assertion appears in the supplied briefing. The HRBP could forward the statement without verifying its source or escalating the gap.

Business consequence: employees receive misleading instructions; HR and managers spend time correcting messages and handling queries; trust and policy-control risk increase. This is a plausible risk scenario, not a documented incident or measured financial loss.

02 Expected versus current performance and evidence quality

Dimension	Expected Level 3 (proposed)	Current state / evidence status
Claim verification	Independently identify each checkable claim, verify against an authorized versioned source, and log the source.	No observed employee baseline or audited real HR drafts. Real performance is unknown.
Correction / escalation	Correct every unsupported claim; escalate unresolved policy statements; retain human approval before release.	Fictional sample draft contains two invented promises; this illustrates a failure mode, not an employee error rate.
Project proof	SME-confirmed Level 3 rubric and completed independent evidence before rating capability.	Draft HRBP-AI-05 standards and demo workbook exist; SME validation, agent execution and live outcomes are unverified.

Existing portfolio uses five fictional employee profiles for routing (two at the proposed target, two needing development, one not assessed). These simulated ratings are not a validated baseline for this skill or for any employer.

03 Root-cause hypotheses: diagnose before prescribing training

Hypothesis / cause type	Evidence to collect	Corrective response
A. Skill gap (training): HRBP cannot separate factual claims from fluent AI wording.	Uncoached pre-test with a new six-claim draft; note omissions and mistaken classifications.	Short guided practice, claim log, feedback and independent reassessment.
B. No approved source owner, version or access (non-training).	Audit source inventory; interview HR policy owner and IT/security.	Publish controlled source pack and version rules; block policy claims without references.
C. Approval and escalation roles unclear (non-training).	Map one draft from creation to release; check reviewer and exception path.	Assign named approver, escalation queue and release checkpoint.
D. Time pressure / workflow incentives (non-training).	Sample draft cycle times and factual rework; manager interviews.	Reserve verification time and include claim check in review workflow.

RECOMMENDATION Diagnostic rule: If missing sources or authority prevent verification, fix that control first. A course cannot authorize a source, approve a policy or replace HR judgment.

Learning intervention & evaluation

Quality-first test design | Transfer to work | Explicit expansion gates

04 One objective, practice activity and independent assessment

Learning objective: Given one unseen fictional HR communication containing six source-dependent claims (three supported, two unsupported, one unresolved) and a version-controlled mock source pack, each HRBP will independently classify 6/6 claims, cite the sources for supported claims, correct 2/2 unsupported statements, escalate 1/1 unresolved policy claim, and add zero invented replacements within 20 minutes.

Practice (30-minute workshop): 5-minute worked demonstration of a claim log (claim -> source/version -> supported / unsupported / unresolved -> action); 15-minute paired practice on Draft A with a mock briefing and job aid; 10-minute comparison to the answer key and facilitator feedback. Mock documents are for teaching only, not company approvals.

Independent assessment (additional 20 minutes): Each learner checks different Draft B alone, without hints or AI auto-validation. A locked answer key and reviewer score the claim log and edited message. Pass = all six classifications correct, supported claims traceable, both unsupported claims removed/corrected, unresolved claim escalated, zero fabricated policy details. Failed attempts receive targeted coaching plus a new-case retest; course completion is not a proficiency rating.

05 30-day measurement plan

Window / owner	Data collection and control	Output / decision
Days 1–5 | HR owner + L&D	Confirm source ownership, tool/privacy approval and human approver. Recruit ~10 HRBPs; assess two parallel mock drafts each before training. If permitted, also audit de-identified existing work.	Record starting claim accuracy, critical misses, rework and time; distinguish simulated from workplace baseline.
Days 6–10 | Facilitator + SME	Run workshop and unseen individual assessment. SME checks answer key and independently re-scores a sample.	Individual pass/fail, error pattern and remediation; report participation separately.
Days 11–20 | Managers + reviewer	For approved, low-risk use only, sample two reviewed drafts per HRBP; log version, critical misses, escalations, corrections, approval and elapsed minutes. No raw employee data in unapproved AI tools.	Observe transfer at the release checkpoint; if access denied, run simulations and label results as learning evidence only.
Days 21–30 | L&D + HR lead	Blind-audit post-work samples, compare with baseline, verify approvals, interview managers and document unresolved process barriers.	Consolidate quality, rework, elapsed time and safety findings; decide expand / remediate / stop.

06 Measures and stage-gate decision

Primary measures: Verified-draft compliance = audited drafts with complete, sourced claim logs and no uncorrected unsupported/unresolved policy claims / all audited drafts. Critical misses = unsupported policy statements or unresolved claims released as fact. Secondary measures: independent Level 3 pass rate; factual corrections per draft; end-to-end checking/approval time; manager confirmation of the process.

PROPOSED GO GATES Expand only to one additional low-risk team if: (1) authorized sources, privacy/tool permission and human approval exist for 100% of sampled tasks; (2) >=90% of learners pass the unseen test; (3) >=95% of workplace drafts are compliant, with an improvement of >=15 percentage points over baseline unless baseline already >=85%; and (4) zero critical escapes or data-handling incidents. Review rework/time but never reward faster drafting at the expense of verification.

NO-GO / REMEDIATE Do not expand if controls are missing, results exist only in simulation, or any critical claim escapes. Fix the non-training cause, rerun the observation and document the decision. All numeric thresholds are proposed acceptance criteria, not achieved results.
